**1 Do I really need security software?**

It's a fair question: back in the days of Windows 9x, it was horribly easy to get a virus. All you had to do was open a dodgy email attachment, click on a malicious web link or plug in an infected USB flash drive. Nowadays, however, Windows has all sorts of protections built-in, and receives regular security updates to ensure that newly-discovered vulnerabilities are fixed before they can be exploited.

So, it's not enough to guarantee your safety. Cybercriminals are constantly looking for new ways to bypass your security, and even if the vast majority of their efforts are thwarted, they only have to get lucky once to ruin your day. And it's not just about technical tricks: the number one vulnerability is – no offence – you. Clever hackers look for ways to duped innocent computer users into installing malicious software, or giving up their valuable credentials.

If you want to minimise your chances of being hit then yes, you need security software. And that doesn't just mean Microsoft's own Windows Defender antivirus: this simple tool blocks the most common threats, but as we discuss on p88, it's not as effective as third-party security software. It's a good idea to at least consider upgrading to something smarter and more effective.

**2 Is free security software worth it?**

You might wonder why anyone would choose to pay for security software when there are several free antivirus tools out there – but the free packages generally come with strings attached. For a start, their interfaces are almost always loaded with adverts, trying to persuade you to upgrade to a paid-for security suite. Quite often you'll see these appear as pop-up notifications, too. We'd have thought this nagging approach would generate more goodwill than sales, but publishers keep doing it so it must be working.

**3 Antivirus or security suite?**

Many security products are offered in two flavours: a basic antivirus tool and a more extensive (and expensive) Internet security suite. Both do the same basic job of detecting and removing malware – the difference is down to the extra features included in the "Internet security suite".

But different publishers have different ideas about where exactly to draw the line. Some "antivirus" products come with more extra features than you would expect, such as browser extensions and password managers –

If you can live with those limitations, though, there's nothing wrong with free antivirus software. Publishers normally use the same scanning systems and databases as in their paid-for suites. After all, it's their reputation on the line if their free product lets a virus slip through.

Symantec – have chosen to ditch the traditional "antivirus" and "security suite" labels altogether. When it comes to choosing a suite, we suggest you forget about the distinction, and check our feature table overleaf for the features that are important to you.

**4 Do I need a 2018 suite?**

A few years back, it was the norm for security vendors to release a major software update each year. That model's on its way out, though. Most of the security suites that this month's Labs don't have any sort of year or version number in their name – and even among the ones that do, you might find that when you install the software the 2018 branding is nowhere to be seen.

If that might seem a bit peculiar, this is good news. Rather than holding back new features and enhancements for an annual update, it's now the norm for publishers to make them available to all users as soon as they're ready. That means you don't have to worry about missing out on updates.

**Adobe Desktop of Windows 10's built-in protection you're still vulnerable to malware**

**"The free packages tend to be basic: they'll block a virus when it appears on your system, but they don't include other features"**
